# Drug levels obtained during infusion

How does DoseMeRx handle labs drawn during infusion

Written by Sharmeen Roy, PharmD, BCPS

Updated over a week ago

Sometimes laboratory values may be recorded while the medication is infusing. When this occurs, the first step is to confirm that the drug level was, in fact, obtained during the infusion.

If the drug level was not drawn during the infusion, updating the drug level to the correct time in DoseMeRx will address the issue. However, if the level was confirmed to be drawn during infusion, we suggest excluding the level as the impact on the model and the subsequent dosing recommendations can be highly variable. The degree of impact varies depending on the half-life of the drug and the point in the infusion that the level was obtained. In these situations, you may want to consider obtaining a new drug level at a time other than when the drug is being infused.
