How important is the time I take a patient's blood test?

Blood tests or assays within DoseMeRx

Written by Sharmeen Roy, PharmD, BCPS

Updated over a week ago

While the time at which you take a blood test may affect accuracy to a certain extent, it is much more important to record the time at which a blood test was taken accurately. DoseMeRx using [Bayesian Dosing](#) methodology can predict the peak and trough of that medication even if the blood test was not taken at the optimal time.

We have found that for antibiotics such as [tobramycin](#), DoseMeRx is shown to be more accurate at estimating AUC than the conventional two-sample method while requiring only one blood sample and allowing the collection of this sample at almost any patient-preferred time.

Read more about this [here](#)!
